

Retention is healthy, but a few accounts swing the numbers

Blended trailing-12-month Gross Revenue Retention (GRR) averages 96% across Jul 2025 – May 2026. The three dips below each trace back to a single churned account in a small segment cohort (1-7 subscriptions), not a broad retention trend.

96%

Average blended GRR

Trailing 12 months
(Jul 2025 – May 2026)

Healthy overall: this is not a systemic retention problem

OCT 2025 • ENTERPRISE

GRR: 77.5%

Verdant Holdings (AU, Technology) churned: \$61.8k ACV lost from a 3-account cohort.

DEC 2025 • MID-MARKET

GRR: 80.0%

Manuka Group (NZ, Consumer Goods) churned: \$24.9k ACV lost from a 3-account cohort.

APR 2026 • SMB

GRR: 64.7%

Quartz Trading (US, Health & Beauty) churned: \$10.2k ACV lost from a 2-account cohort.

Recommendations for Customer Success

GRR is strong because most of the customer base renews reliably. The risk that remains is concentrated in a small number of high-ACV accounts, so CS effort should follow that concentration.

Give Enterprise renewals white-glove treatment

A single Enterprise churn swings that segment's monthly GRR by ~20 points: Oct 2025 fell to 77.5% on one account. Assign a named owner to every Enterprise renewal, start engagement 60-90 days before contract end, and require a signed-off success plan before the renewal window opens.

Stand up an account-level renewal watchlist

Segment-level GRR can look healthy while one large account is quietly at risk inside a small cohort (most segment/month cohorts are just 1-7 subscriptions). Track every upcoming renewal by account and ACV, with explicit health flags, rather than relying on aggregate segment metrics alone.

Run churn post-mortems on the three lost accounts

Review Verdant Holdings (Oct '25, Enterprise, AU), Manuka Group (Dec '25, Mid-Market, NZ), and Quartz Trading (Apr '26, SMB, US) for shared early-warning signals: usage decline, support tickets, champion turnover. Use them to flag similar accounts before they reach risk.
